When I try to execute it using JNI my C++ code seems to be called but when I execute it from a native application it doesn't seem to work. This is my native c++ code that I'm trying to execute from my Android application:

Q: Particular 2-D quaternions I have a set of quaternions q_n that I want to form a 2-D group. The set is as follows:
 $q_1 = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$ $q_2 = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix}$ $q_3 = \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix}$ $q_4 = \begin{pmatrix} 0 & 0 \\ 0 & -1 \end{pmatrix}$ $q_5 = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$ $q_6 = \begin{pmatrix} -1 & 0 \\ 0 & 0 \end{pmatrix}$ My question is if this is a 2-D group or not. I know that every group must have at least one identity element, but I do not know what to say about this group. The identity element of this group is q_1 since it is an element of the matrix $\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$. A: I believe this is the Klein four group $\mathbb{Z}_2 \times \mathbb{Z}_2$. The subgroup $\langle q_3 \rangle$ is just a copy of the non-abelian group \mathbb{Z}_2 . If you wanted to get more familiar with this type of thing, you could try looking up the 48-cell and other constructions of quaternion groups over the real numbers.

MS Word Pages Split is a practical and easy-to-use software application made to help you cut Microsoft Word documents into multiple pages and save them as separate files. It features a few splitting methods and can be handled by first-time and experienced users alike. Simple setup and modern appearance The setup operation is fast and doesn't require special attention. Worth noting, though, is that you need to have Microsoft Word installed in order for MS Word Pages Split to fully work. It's wrapped in a clear-cut and attractive window that takes cue from the MS Office 2013 look. You can open as many DOC, DOCX and RTF docs as you want, and check out their names, full paths, times, pages and sizes. Configure settings to split documents It's possible to split the files by setting a page frequency, or by specifying the exact page numbers or ranges. What's more, you can align sentences and paragraphs. In case the document has a table of contents (e.g. ebooks), then you can explore its pages by chapters and specify the page range within each chapter. Furthermore, you can select the output file naming pattern between two options, and ask the utility to automatically open the target destination on task completion. By opening the right-click menu of any selected file in the list, you can view its source or result, or remove it from the job list.

Evaluation and conclusion We haven't come across any stability issues in our tests, thanks to the fact that the tool didn't hang, crash or prompt error dialogs. It has a great look and minimal impact on the overall performance of the machine, using low CPU and RAM. Tasks are carried out swiftly. On the other hand, MS Word Pages Split's small set of features doesn't account for the price of the registered edition, especially since it cannot work without Microsoft Office. Nevertheless, you can test the program for yourself to make that decision. If you want to apply formatting to the split file, you're out of luck, since there is no way of getting that done.
