If I type in a large number like this one (which is longer than 80 characters):
1.234567890123456789012345678901234567890123456789012345678901234567890 Is there a way to "print" this whole number to the screen as a single number (not in a string) using a C++ array of characters? I'm thinking I could write a function which checks for the n-th number and if it is n, then print it. If there is something wrong with this method or I should use a different approach, I would be happy to know it, but first of all I don't know how to start. A: As Exabyte said, this is not possible. What you can do (which is better than nothing) is to print the numbers starting from some number that you know will never exceed the number of characters, for example, the first ten digits: print(
