**Logic Pro 9.1.8 Serial Number Mac**

---

The fourth generation of Apple's popular Macintosh computer, introduced in January 2003, was officially known as the iMac iMac4,4 in the United Kingdom. Although a major redesign, many other features and improvements were included on the iMac4,4. The iMac3,5, introduced in December 2002, was the final version of the original Macintosh computer released by Apple. It was the first Macintosh computer capable of running Mac OS X. Every previous iMac (and Mac OS X itself) had used the Intel 80386SX microprocessor (the Motorola 68020-compatible) as its primary processor. However, the iMac4,4 includes an Intel 80386 processor, despite its Macintosh hardware compatibility. While the iMac4,4 is backward compatible with the PowerPC-based iMac3,5, they are two completely different computers, and there is no common ancestor. The iMac4,4 replaced the original iMac and was succeeded by the fifth-generation iMac in July 2005. The first Macintosh computer (which Apple Inc. then registered as the "Macintosh" trademark) was introduced by Steve Jobs and Steve Wozniak on April 24, 1977, at the West Coast Homebrew Computer Club, a gathering of hobbyists with a common interest in creating and exploring personal computing and their peers for their ideas and solutions. On September 23, 1977, the first shipments of the Mac were delivered to 300 Apple stores in North America. It was never the intention to make money on the Macintosh, as Apple became a publicly-traded company in 1980. Instead, Apple produced the Macintosh as a computer to be sold to hobbyists, universities, and other organizations and individuals who wanted to buy a relatively inexpensive, relatively easy-to-use computer. The first generation of Macintoshes used a Motorola 68000 processor and a custom motherboard. The second generation (Macintosh II) added new features, such as a built-in floppy drive and a hard disk, but it continued to use a hardware keyboard and external mouse with a proprietary 30-pin connector. Third-generation Macintoshes (Macintosh IIx) added an in-line modem as part of the mouse port. Third-generation Macintosh computers never had a floppy drive. A limitation of the original third-generation Macintosh was that the processor could not run multiple programs at once. The fourth generation of the Macintosh, which was released in January 2003, included the addition of d0c515b9f4
