## Tp-link Tl-wr340gd V5 Firmware 28 Fix

With this TP-Link WR340N router I was never able to connect my Android box (by following the directions this web page ) it always says "error not supported" and I had to do a factory reset on the router. I tried several diff. operating system including win 8, win 7 64 bit, win 7 32 bit, ubuntu 15.10 and ubuntu 15.04. Note: If you decide to use this installer over the existing factory firmware, TP-LINK warns that you may lose data in the flash memory on your router if something goes wrong during the install. The risks can be avoided by making a backup image of your flash memory. Note: A side effect of using this flash file is that you may lose any custom firmware configuration you had. If you have made custom settings such as your specific WAN or LAN IP addresses, they will be lost. Warning: Uploading an incompatible firmware may cause the router to crash. Please fully read our updated release notes before flashing the firmware! If in any doubt contact support directly via <https://www.tplink.net/en/products/net/help-desk> Content: Reboot router to update firmware Wifi local MAC binding may be necessary after FW update WPS lacks a step, may be reassign WPS PIN Reroute IP 192.168.0.0/24 LAN to 192.168.1.0/24 wireless Improvement to admin interface TCP Control Timer for NTP synchronization may suffer from edge case GUI improvements to improve stability

## Tp-link TL-wr340gd V5 Firmware 28

Without the "cut the cable" bug, I was able to fix the "PAN ID" issue. The "ac-os" is not supported by TP-LINK, so I switch it to "stanbg". Then I can use the same PAN ID as the TL-WN321G instead of "Auto" or "mac-os". So, I got myself a spare Netgear R6300 router and wired everything up. The 2.4G ports did not function for some reason, but Ethernet worked fine. When I powered on the R6300, it immediately loaded the firmware which turned out to be v1.0.11. So once again, I just flashed the firmware to v1.0.12. I didn't upload the firmware file to TP-LINK, and I'm not sure if the newer firmware will actually work. Who knows? I used some software called Jalink to access and update my firmware. After the firmware is flashed, it will auto download the new firmware. Therefore, it is advised that you always connect to the network to download firmware instead of downloading it from the router's software (program). This guide will install the firmware (not update or downgrade the firmware) from TP-LINK.com to your TP-LINK router. Please note that this may void your warranty, and flashing the firmware may brick your TP-LINK router. You can verify this by plugging in the power source back in and see if the network light starts blinking. If the light is blinking, that means the router has been bricked and there's nothing you can do about it. TFTP flashing currently works with 29 and 28 firmware. Upgrades to 29 are possible, however there are some issues regarding the SHA1 matching that will be resolved in the next version. Use suunto-firmware-upgrade-firmware on Windows 10 and update as early as possible. 5ec8ef588b
